

Framing Aims and Objectives

The aims and objectives are what you aim to do to answer your research question.

Example:

Research question: Is iron deficiency anemia during the second and third trimesters, as measured by a hemoglobinometer, a cause for low birth weight among singleton babies born after 2005 to primi mothers?

Aims:

- To determine a contributory cause of iron deficiency anemia for low birth weight among singleton babies born after 2005 to primi mothers
 - To determine a temporal relationship between iron deficiency anemia and low birth weight
 - To determine a dose response relationship between iron deficiency anemia and low birth weight among singleton babies born after 2005 to primi mothers
 - To determine the strength of the association between iron deficiency anemia and low birth weight among singleton babies born after 2005 to primi mothers

THIS IS THE PRIMARY AIM- THE MOST IMPORTANT AIM OF THE STUDY BASED ON YOUR QUESTION.

You can have secondary aims

- To determine if iron deficiency anemia is associated with increased mortality and morbidity among primi mothers

The secondary aims should have relevance to your study question.
